

What is claimed and desired to be secured by United States Letters Patent is:

1. A sulphurous acid generator comprising:
2 a supply of sulphur dioxide gas conducted in a first conduit and means for drawing
3 the sulphur dioxide gas through the first conduit;
4 a supply of water conducted in a second conduit; and
5 a third conduit comprising:
6 a blending portion, at least one contact containment portion, and at least one
7 agitation portion,
8 the blending portion comprising means for bringing the sulphur
9 dioxide gas in the first conduit and ~~water from~~ ^{A2} substantially all the water
10 in the second conduit into contained, codirectional flow
11 whereby the sulphur dioxide gas and water are brought into
12 contact with each other,
13 the contact containment portion(s) comprising a passageway through
14 which the sulphur dioxide gas and substantially all the water
15 codirectionally flow in contact with each other and in which
16 at least a portion of the sulphur dioxide gas reacts with water
17 to form sulphurous acid,
18 the agitation portion(s) comprising means for mixing and agitating
19 the codirectionally flowing sulphur dioxide gas and
20 water/sulphurous acid to facilitate the reaction and
21 dispersemnt of sulphur dioxide gas ^{A3} with the
22 water/sulphurous acid, and
23
24 means for discharging the sulphurous acid and unreacted sulphur dioxide gas,
25
26

1 the first and third conduits defining an open system thereby avoiding
2 subjecting the sulphur dioxide gas to a system pressure.

3 2. The sulphurous acid generator of claim 1 further comprising:
4 a mixing tank into which the sulphurous acid and unreacted sulphur dioxide are
5 discharged from the third conduit, the mixing tank temporarily retaining the
6 discharged sulphurous acid in a submersion pool;
7 means for facilitating and maintaining the submersion of unreacted sulphur dioxide
8 gas discharged from the third conduit into the submersion pool of sulphurous
9 acid to substantially reduce the separation of unreacted sulphur dioxide gas
10 from contact with the sulphurous acid to promote further reaction of the
11 sulphur dioxide gas into the sulphurous acid; and
12 *Subject to ambient pressure*
13 the mixing tank defining an outlet through which the sulphurous acid may pass to
14 exit the mixing tank,
15 the mixing tank, the facilitating and maintaining means, and the outlet defining an
16 open system thereby avoiding subjecting the sulphur dioxide gas to a system
17 pressure.

18 3. The sulphurous acid generator of claim 2 further comprising:
19 an absorption tower into which free floating unreacted sulphur dioxide gas passes
20 from the mixing tank, the absorption tower comprising means for creating a
21 flow of water counter-current to the flow of sulphur dioxide gas, the tower
22 containing a tortuous maze of pathways through which the water and sulphur
23 dioxide gas will pass in counter-current flow, and in which sulphur dioxide
24 gas and water come into contact to form sulphurous acid,
25 the absorption tower having an exhaust vent through which sulphur dioxide

1 not reacted in the tower may pass.

2

3 4. The sulphurous acid generator of claim 3 further comprising:

4 a supply of unreacted sulphur dioxide gas conducted in a vent conduit in

5 communication with the exhaust vent and means for drawing the sulphur

6 dioxide gas through the vent conduit;

7 a supply of water conducted in a supplemental water conduit;

8 a fourth conduit comprising:

9 a blending portion, at least one contact containment portion, and at least one

10 agitation portion;

11 the blending portion comprising means for bringing the sulphur *water from*
12 dioxide gas in the vent conduit and ~~substantially all the water~~ contained,
13 in the supplemental water conduit into contained,
14 codirectional flow whereby the sulphur dioxide gas and water
15 are brought into contact with each other,
16 the contact containment portion(s) comprising a passageway through
17 which the sulphur dioxide gas and substantially all the water
18 codirectionally flow in contact with each other and in which
19 at least a portion of the sulphur dioxide gas reacts with the
20 water to form sulphurous acid,

21 the agitation portion(s) comprising means for mixing and agitating
22 the codirectionally flowing sulphur dioxide gas and
23 water/sulphurous acid to facilitate the reaction and
24 dispersement of sulphur dioxide gas into the water/sulphurous
25 acid, and

26
